

Assignment

Guess my age

The assignment is to write a program that will print if my age is correct, lower, or higher than my age that is 43.

- Create a variable named age in the beginning of your program which is assigned to your favorite number between 1-100
- Write 3 **if, elseif, else -statements** which will print out
 - “My age is higher” if age is higher than 43
 - “My age is lower” if age is lower than 43
 - “You found my age” if age is equal to 43
- Then modify the age variable to make sure that all output works correct

Do not simply copy and paste your code here when submitting your solution (the indentations might get lost) do it from scratch.

If you are using online tool copy and paste your code into Notepad or similar and save it into a .cpp file with your name in the file name, which you can upload here instead.

Good luck!
