Printing numbers

The assignment is to write a program that prints digits 0 up to the number the user enters by **using a for loop**.

- The user should be asked to “Enter a number:”, and this number should be saved to a variable named `user_input`
- You do not need to handle if the user inputs something else than a number so use an *int* as datatype
- Create a for loop that loops from 0 up to the given `user_input` and print the values to the console screen with line breaks between each other

For example, if the user entered 3, the output should be:

0

1

2

Good luck!
