

Exercise 2i - The do while-loop

Beskrivning

In the previous exercise we used the while loop. The while loop can be used in the “other way” by a do-while loop. example:

```
int number = 0;
do
{
    std::cout << number++; // print, then increase
} while (number < 3);
```

The number will be increased inside the do-while loop and will run until the *while* statement is false.

Exercise 2i

- Rewrite the program in exercise 2f with a do-while loop instead
