

Exercise 2d - Namespace

Beskrivning

It is possible to use multiple namespaces if they do not have the same named operands inside the namespace

Example:

```
using namespace kalle;
```

```
using namespace stina;
```

If the above namespaces have operands with same name you need to call, then directly outside the namespace.

Exercise 2d

- Create a program that contains a namespace named `rectangle` with 2 int argument `x` and `y`.
- Use both namespace `std` and `rectangle`.
- In the code set `x` and `y` values to 2 and print them out on the screen like "*Rectangle x:2 y:2*" by using variable `x` and `y`
