Printing number refactored

It is always good to practice using both kinds of loops so in this assignment you will rewrite the number table assignment but using a while loop. The program should have the same behaviour as assignment 2a.

Then also add a do-while loop after that that prints the same numbers but in the other direction. The second loop will then write numbers from the entered value down to 0

Example: if the user enters 3 as input

0

1

2

2

1

0

Good luck!
